## **e-Justice Case Studies at National and European Level**

National and European case studies have been conducted to produce a thick description of the strategies adopted to develop the system under examination, the development history, the architectural configuration, the growth of the infrastructure supporting ICT enabled procedures and the current functioning of the system.

The case study analysis has been developed along three main lines:

- longitudinal (history and strategy): how it came about (major critical events)
- architecture at present (configuration of the system), how it is made;
- functioning: how it works now.

Also, the case study highlights the main interoperability problems that have been met in dealing with the development of national and European systems, together with the design solutions that have been adopted and implemented.

All the papers will be available by mid May.
